

# Contents

Preface	xii
<b>I BASIC MECHANICS</b>	<b>1</b>
<b>1 Particle Kinematics</b>	<b>3</b>
1.1 Particle Position Description	3
1.1.1 Basic Geometry	3
1.1.2 Cylindrical and Spherical Coordinate Systems	6
1.2 Vector Differentiation	8
1.2.1 Angular Velocity Vector	8
1.2.2 Rotation about a Fixed Axis	10
1.2.3 Transport Theorem	11
1.2.4 Particle Kinematics with Moving Frames	15
<b>2 Newtonian Mechanics</b>	<b>25</b>
2.1 Newton's Laws	25
2.2 Single Particle Dynamics	29
2.2.1 Constant Force	29
2.2.2 Time-Varying Force	32
2.2.3 Kinetic Energy	35
2.2.4 Linear Momentum	36
2.2.5 Angular Momentum	37
2.3 Dynamics of a System of Particles	40
2.3.1 Equations of Motion	40
2.3.2 Kinetic Energy	43
2.3.3 Linear Momentum	44
2.3.4 Angular Momentum	47
2.4 Dynamics of a Continuous System	49
2.4.1 Equations of Motion	49
2.4.2 Kinetic Energy	50
2.4.3 Linear Momentum	51
2.4.4 Angular Momentum	52
2.5 The Rocket Problem	53

<b>3</b>	<b>Rigid Body Kinematics</b>	<b>65</b>
3.1	Direction Cosine Matrix . . . . .	66
3.2	Euler Angles . . . . .	72
3.3	Principal Rotation Vector . . . . .	80
3.4	Euler Parameters . . . . .	87
3.5	Classical Rodrigues Parameters . . . . .	93
3.6	Modified Rodrigues Parameters . . . . .	98
3.7	Other Attitude Parameters . . . . .	105
3.7.1	Stereographic Orientation Parameters . . . . .	105
3.7.2	Higher Order Rodrigues Parameters . . . . .	107
3.7.3	The (w,z) Coordinates . . . . .	108
3.7.4	Cayley-Klein Parameters . . . . .	109
3.8	Homogeneous Transformations . . . . .	109
<b>4</b>	<b>Eulerian Mechanics</b>	<b>117</b>
4.1	Rigid Body Dynamics . . . . .	117
4.1.1	Angular Momentum . . . . .	117
4.1.2	Inertia Matrix Properties . . . . .	120
4.1.3	Euler's Rotational Equations of Motion . . . . .	125
4.1.4	Kinetic Energy . . . . .	127
4.2	Torque-Free Rigid Body Rotation . . . . .	131
4.2.1	Energy and Momentum Integrals . . . . .	131
4.2.2	General Free Rigid Body Motion . . . . .	136
4.2.3	Axisymmetric Rigid Body Motion . . . . .	137
4.3	Momentum Exchange Devices . . . . .	138
4.3.1	Spacecraft with Single VSCMG . . . . .	140
4.3.2	Spacecraft with Multiple VSCMGs . . . . .	146
4.4	Gravity Gradient Satellite . . . . .	147
4.4.1	Gravity Gradient Torque . . . . .	148
4.4.2	Rotational - Translational Motion Coupling . . . . .	150
4.4.3	Small Departure Motion about Equilibrium Attitudes . . . . .	151
<b>5</b>	<b>Generalized Methods of Analytical Dynamics</b>	<b>163</b>
5.1	Generalized Coordinates . . . . .	163
5.2	D'Alembert's Principle . . . . .	166
5.2.1	Virtual Displacements and Virtual Work . . . . .	166
5.2.2	Classical Development of D'Alembert's Principle . . . . .	168
5.2.3	Holonomic Constraints . . . . .	175
5.2.4	Newtonian Constrained Dynamics of $N$ Particles . . . . .	182
5.2.5	Lagrange Multiplier Rule for Constrained Optimization . . . . .	183
5.3	Lagrangian Dynamics . . . . .	187
5.3.1	Minimal Coordinate Systems and Unconstrained Motion . . . . .	188
5.3.2	Lagrange's Equations for Conservative Forces . . . . .	192
5.3.3	Redundant Coordinate Systems and Constrained Motion . . . . .	195
5.3.4	Vector-Matrix Form of the Lagrangian Equations of Motion . . . . .	200
5.3.5	Quasi-Coordinates . . . . .	203

---

5.3.6	Final Observations . . . . .	211
<b>6</b>	<b>Variational Methods in Analytical Dynamics</b>	<b>217</b>
6.1	Fundamentals of Variational Calculus . . . . .	217
6.2	Hamilton's Variational Principles . . . . .	221
6.2.1	Virtual Displacements Versus Path Variations . . . . .	221
6.2.2	Hamilton's Principle Derived from D'Alembert's Principle	222
6.3	Hamilton's Principal Function . . . . .	225
6.4	Classical Applications of Hamilton's Principle . . . . .	227
6.5	Lagrange's Equations for Hybrid Systems . . . . .	233
<b>7</b>	<b>Hamilton's Generalized Formulations</b>	<b>243</b>
7.1	The Hamiltonian Function . . . . .	243
7.2	Ignorable Coordinates . . . . .	248
7.3	Hamiltonian Work/Energy Integral . . . . .	249
7.4	Hamilton's Canonical Equations . . . . .	253
7.5	Poisson's Brackets . . . . .	256
7.6	Canonical Coordinate Transformations . . . . .	259
7.7	Perfect Differential Criterion . . . . .	262
7.8	Transformation Jacobian Perspective . . . . .	265
<b>8</b>	<b>Nonlinear Spacecraft Stability and Control</b>	<b>271</b>
8.1	Nonlinear Stability Analysis . . . . .	272
8.1.1	Stability Definitions . . . . .	272
8.1.2	Linearization of Dynamical Systems . . . . .	276
8.1.3	Lyapunov's Direct Method . . . . .	278
8.2	Generating Lyapunov Functions . . . . .	285
8.2.1	Elemental Velocity-Based Lyapunov Functions . . . . .	287
8.2.2	Elemental Position-Based Lyapunov Functions . . . . .	294
8.3	Nonlinear Feedback Control Laws . . . . .	299
8.3.1	Unconstrained Control Law . . . . .	299
8.3.2	Asymptotic Stability Analysis . . . . .	302
8.3.3	Feedback Gain Selection . . . . .	308
8.4	Lyapunov Optimal Control Laws . . . . .	313
8.5	Linear Closed-Loop Dynamics . . . . .	319
8.6	Reaction Wheel Control Devices . . . . .	324
8.7	Variable Speed Control Moment Gyroscopes . . . . .	326
8.7.1	Control Law . . . . .	327
8.7.2	Velocity Based Steering Law . . . . .	330
8.7.3	VSCMG Null Motion . . . . .	335
<b>II</b>	<b>CELESTIAL MECHANICS</b>	<b>351</b>
<b>9</b>	<b>Classical Two-Body Problem</b>	<b>353</b>
9.1	Geometry of Conic Sections . . . . .	354

9.2	Relative Two-Body Equations of Motion . . . . .	362
9.3	Fundamental Integrals . . . . .	364
9.3.1	Conservation of Angular Momentum . . . . .	364
9.3.2	The Eccentricity Vector Integral . . . . .	365
9.3.3	Conservation of Energy . . . . .	368
9.4	Classical Solutions . . . . .	375
9.4.1	Kepler's Equation . . . . .	375
9.4.2	Orbit Elements . . . . .	379
9.4.3	Lagrange/Gibbs F and G Solution . . . . .	385
<b>10</b>	<b>Restricted Three-Body Problem</b>	<b>393</b>
10.1	Lagrange's Three-Body Solution . . . . .	394
10.1.1	General Conic Solutions . . . . .	394
10.1.2	Circular Orbits . . . . .	403
10.2	Circular Restricted Three-Body Problem . . . . .	407
10.2.1	Jacobi Integral . . . . .	408
10.2.2	Zero Relative Velocity Surfaces . . . . .	414
10.2.3	Lagrange Libration Point Stability . . . . .	421
10.3	Periodic Stationary Orbits . . . . .	426
10.4	The Disturbing Function . . . . .	427
<b>11</b>	<b>Gravitational Potential Field Models</b>	<b>433</b>
11.1	Gravitational Potential of Finite Bodies . . . . .	434
11.2	MacCullagh's Approximation . . . . .	437
11.3	Spherical Harmonic Gravity Potential . . . . .	440
11.4	Multi-Body Gravitational Acceleration . . . . .	449
11.5	Spheres of Gravitational Influence . . . . .	451
<b>12</b>	<b>Perturbation Methods</b>	<b>457</b>
12.1	Encke's Method . . . . .	458
12.2	Variation of Parameters . . . . .	460
12.2.1	General Methodology . . . . .	461
12.2.2	Lagrangian Brackets . . . . .	463
12.2.3	Lagrange's Planetary Equations . . . . .	469
12.2.4	Poisson Brackets . . . . .	476
12.2.5	Gauss' Variational Equations . . . . .	483
12.3	State Transition and Sensitivity Matrix . . . . .	488
12.3.1	Linear Dynamic Systems . . . . .	488
12.3.2	Nonlinear Dynamic Systems . . . . .	493
12.3.3	Symplectic State Transition Matrix . . . . .	495
12.3.4	State Transition Matrix of Keplerian Motion . . . . .	497

<b>13 Transfer Orbits</b>	<b>505</b>
13.1 Minimum Energy Orbit . . . . .	506
13.2 The Hohmann Transfer Orbit . . . . .	509
13.3 Lambert’s Problem . . . . .	514
13.3.1 General Problem Solution . . . . .	515
13.3.2 Elegant Velocity Properties . . . . .	519
13.4 Rotating the Orbit Plane . . . . .	522
13.5 Patched-Conic Orbit Solution . . . . .	527
13.5.1 Establishing the Heliocentric Departure Velocity . . . . .	528
13.5.2 Escaping the Departure Planet’s Sphere of Influence . . . . .	533
13.5.3 Entering the Target Planet’s Sphere of Influence . . . . .	539
13.5.4 Planetary Fly-By’s . . . . .	544
<b>14 Spacecraft Formation Flying</b>	<b>551</b>
14.1 General Relative Orbit Description . . . . .	553
14.2 Cartesian Coordinate Description . . . . .	554
14.2.1 Clohessy-Wiltshire Equations . . . . .	555
14.2.2 Closed Relative Orbits in the Hill Reference Frame . . . . .	559
14.3 Orbit Element Difference Description . . . . .	562
14.3.1 Linear Mapping Between Hill Frame Coordinates and Orbit Element Differences . . . . .	564
14.3.2 Bounded Relative Motion Constraint . . . . .	568
14.4 Relative Motion State Transition Matrix . . . . .	570
14.5 Linearized Relative Orbit Motion . . . . .	575
14.5.1 General Elliptic Orbits . . . . .	575
14.5.2 Chief Orbits with Small Eccentricity . . . . .	579
14.5.3 Near-Circular Chief Orbit . . . . .	581
14.6 $\mathbf{J}_2$ -Invariant Relative Orbits . . . . .	585
14.6.1 Ideal Constraints . . . . .	586
14.6.2 Energy Levels between $\mathbf{J}_2$ -Invariant Relative Orbits . . . . .	593
14.6.3 Constraint Relaxation Near Polar Orbits . . . . .	594
14.6.4 Near-Circular Chief Orbit . . . . .	597
14.6.5 Relative Argument of Perigee and Mean Anomaly Drift . . . . .	598
14.6.6 Fuel Consumption Prediction . . . . .	601
14.7 Relative Orbit Control Methods . . . . .	605
14.7.1 Mean Orbit Element Continuous Feedback Control Laws . . . . .	605
14.7.2 Cartesian Coordinate Continuous Feedback Control Law . . . . .	614
14.7.3 Impulsive Feedback Control Law . . . . .	617
14.7.4 Hybrid Feedback Control Law . . . . .	621
<b>APPENDIX A: Transport Theorem Derivation Using Linear Algebra</b>	<b>629</b>
<b>APPENDIX B: Various Euler Angle Transformations</b>	<b>633</b>
<b>APPENDIX C: MRP Identity Proof</b>	<b>637</b>

<b>APPENDIX D: Conic Section Transformations</b>	<b>639</b>
<b>APPENDIX E: MATLAB M-Files</b>	<b>643</b>
<b>APPENDIX F: First-Order Mapping Between Mean and Osculating Orbit Elements</b>	<b>647</b>
<b>APPENDIX G: Direct Linear Mapping between Cartesian Hill frame Coordinates and Orbit Element Differences</b>	<b>651</b>
<b>APPENDIX H: Hamel Coefficients for the Rotational Motion of a Rigid Body</b>	<b>653</b>
